

12. Test Closure Phase

12.1 Introduction

The Test Closure Phase is the final stage of the Software Testing Life Cycle (STLC). It is performed after completing all test execution activities. This phase ensures that all planned test cases have been executed, results have been analyzed, defects have been documented, and final reports have been prepared.

In this project, the Test Closure Phase is applied to the **OWASP Juice Shop Security Testing Automation Framework**, where all security-related test cases such as SQL Injection, XSS, authentication, input validation, and session security are executed using Selenium WebDriver and TestNG.

The main purpose of this phase is to formally conclude the testing process and provide a complete summary of test execution outcomes.

12.2 Test Closure Report

Introduction

The Test Closure Report is a formal document that summarizes the entire testing activity. It provides detailed information about test execution results, test coverage, defects found, and overall quality of the application.

For this project, the Test Closure Report represents the final status of security testing performed on the OWASP Juice Shop application using automation scripts.

Contents of Test Closure Report

- Summary of test execution (total executed, passed, failed)
- List of executed test scenarios
- Security testing coverage (SQL Injection, XSS, etc.)
- Defect summary (if any vulnerabilities are found)
- Automation framework execution status
- Test environment details
- Overall testing conclusion
