

13.2 Risk Assessment Report

Introduction

The Risk Assessment Report evaluates the severity and impact of identified security vulnerabilities. It helps in understanding how dangerous a vulnerability is to the application, users, and system data.

Each risk is classified based on:

- Impact on system
 - Likelihood of exploitation
 - Severity level (High, Medium, Low)
-

Risk Categories Identified

1. SQL Injection Risk

- Risk Level: High
 - Impact: Unauthorized database access, data leakage
 - Description: Malicious SQL payloads may manipulate backend queries if input validation fails
-

2. Cross-Site Scripting (XSS) Risk

- Risk Level: High
 - Impact: Session hijacking, malicious script execution in browser
 - Description: Improper input sanitization may allow execution of JavaScript payloads
-

3. Input Validation Risk

- Risk Level: Medium
 - Impact: Incorrect or malicious data processing
 - Description: Application may accept invalid or malformed inputs without proper validation
-

4. Error Handling Risk

- Risk Level: Medium
- Impact: Exposure of system information
- Description: Detailed error messages may reveal internal system or database structure

5. Session Management Risk

- Risk Level: Medium
- Impact: Unauthorized access after logout
- Description: Session tokens may not be fully invalidated after logout
