

7.2 OWASP Juice Shop Setup

Introduction

OWASP Juice Shop is a deliberately insecure web application used for security training and testing. It contains real-world vulnerabilities such as SQL Injection, Cross-Site Scripting (XSS), authentication flaws, and input validation issues.

In this project, OWASP Juice Shop is used as the target application for executing security test cases and validating automation scripts.

Objective

- To deploy OWASP Juice Shop locally
 - To make the application accessible for testing
 - To validate application readiness for security testing
 - To ensure all modules are functional for automation scripts
-

Installation Steps

- Install Node.js runtime environment
 - Clone OWASP Juice Shop repository from GitHub
 - Navigate to project directory
 - Install dependencies using command:
 - `npm install`
 - Start application using command:
 - `npm start`
-

Application Access

- Open browser (Google Chrome)
 - Navigate to:
 - `http://localhost:3000`
 - Verify application loads successfully
-

Modules Verified

- Login Page
- Registration Page

- Feedback / Contact Page
 - Product browsing interface
 - User session handling
-

Validation

- Application runs successfully on local server
 - All UI components are accessible
 - Input fields are active for testing
 - Application is ready for security payload execution
-

Outcome

OWASP Juice Shop application was successfully deployed and verified, making it ready for security testing and automation execution.

Conclusion

The environment setup and application deployment together form the foundation of the testing process. A stable environment ensures accurate execution of security test cases, while OWASP Juice Shop provides a realistic platform for validating vulnerabilities using automation testing.
