

6. Test Scenarios

Introduction:

Test scenarios represent the business workflows that were selected for load testing. These scenarios simulate real user activities performed on the BlazeDemo Flight Booking Application.

The purpose of creating multiple scenarios is to evaluate the performance of individual business transactions as well as the complete booking process. Each scenario represents a specific user journey and was implemented as a separate Gatling simulation.

The following scenarios were identified and executed during the load testing process:

1. Search Flights
2. Choose Flight
3. Complete Booking

These scenarios cover the major functionalities of the application and provide a realistic representation of user behavior.

6.1 Scenario 1 – Search Flights

Scenario Description

This scenario evaluates the flight search functionality of the BlazeDemo application.

The scenario begins when a user accesses the home page and searches for available flights by selecting a departure city and destination city.

The objective of this scenario is to verify the application's ability to process flight search requests and return available flight information within an acceptable response time.

Business Workflow

Home Page

↓

Select Departure City

↓

Select Destination City

Find Flights

Display Available Flights

Test Steps

Step 1: Open Home Page

The user accesses the BlazeDemo home page.

Step 2: Select Departure City

The user selects a departure city from the available list.

Example:

Paris

Step 3: Select Destination City

The user selects a destination city.

Example:

Buenos Aires

Step 4: Search Flights

The user clicks the "Find Flights" button.

Step 5: Display Search Results

The application displays a list of available flights matching the selected route.

Purpose of Testing

The primary purpose of this scenario is to:

- Verify flight search functionality.
 - Measure search request response time.
 - Validate application availability.
 - Evaluate performance under concurrent search requests.
-

Expected Result

The application should successfully display available flights and return an HTTP Status Code 200 without any errors.
