

6.3 Scenario 3 – Complete Booking

Scenario Description

This scenario represents the complete end-to-end business transaction of the BlazeDemo application.

The user performs all activities required to book a flight, including searching flights, selecting a flight, entering passenger details, and confirming the purchase.

This scenario simulates a real-world booking process and is considered the most critical workflow in the application.

Business Workflow

Home Page

Find Flights

Display Available Flights

Choose Flight

Enter Passenger Details

Purchase Flight

Confirmation Page

Test Steps

Step 1: Open Home Page

The user accesses the BlazeDemo application.

Step 2: Search Flights

The user selects departure and destination cities and searches for flights.

Step 3: Select Flight

The user chooses a preferred flight from the available options.

Step 4: Enter Passenger Details

The user enters booking information such as:

- Name
- Address
- City
- State
- Zip Code
- Credit Card Details

Step 5: Purchase Flight

The user submits the booking form.

Step 6: Booking Confirmation

The application processes the request and displays the confirmation page.

Purpose of Testing

The primary objective of this scenario is to:

- Validate the complete booking workflow.
 - Measure end-to-end transaction performance.
 - Verify booking confirmation processing.
 - Evaluate system stability during business-critical transactions.
 - Analyze application behavior under load conditions.
-

Expected Result

The application should successfully process the booking request and display the confirmation page containing the purchase confirmation message.

No transaction failures, server errors, or unexpected delays should occur during execution.

Scenario Summary

The three scenarios implemented in this project represent the core business functionalities of the BlazeDemo Flight Booking Application.

Scenario 1 focuses on flight search operations, Scenario 2 focuses on flight selection activities, and Scenario 3 validates the complete booking process. Together, these scenarios provide comprehensive coverage of the application's primary business workflows and enable effective performance evaluation under simulated user load conditions.
