

# 8. Test Data

## 8.1 Introduction

Test data refers to the input values used during the execution of load testing scenarios. These values are supplied to the application to simulate realistic user interactions and validate business workflows.

In this project, test data was used to perform flight searches, select flights, and complete booking transactions within the BlazeDemo Flight Booking Application.

The selected test data represents typical user information required to perform a flight reservation. Consistent test data was used throughout the execution process to ensure reliable and repeatable test results.

---

## 8.2 Purpose of Test Data

The primary purpose of test data is to:

- Simulate realistic user activities.
- Execute business workflows successfully.
- Validate application functionality under load.
- Generate meaningful performance results.
- Ensure consistency across multiple test executions.

The same set of test data was used for all virtual users during the load testing process.

---

## 8.3 From City

The departure city represents the location from which the user intends to travel.

During flight search operations, the departure city was selected from the list of cities available on the BlazeDemo home page.

### Test Data Used

| Field     | Value |
|-----------|-------|
| From City | Paris |

### Usage

The selected departure city was submitted as part of the flight search request.

Example:

```
Departure City = Paris
```

This value was used in all implemented test scenarios.

---

## 8.4 To City

The destination city represents the location to which the user intends to travel.

The destination city was selected from the available options provided by the application.

### Test Data Used

| Field   | Value        |
|---------|--------------|
| To City | Buenos Aires |

### Usage

The destination city was submitted along with the departure city during flight search operations.

Example:

```
Destination City = Buenos Aires
```

The application used this information to display matching flight options.

---

## 8.5 Flight Details

After searching for available flights, the application displays a list of flights that match the selected route.

One of the available flights was selected during the execution of Scenario 2 and Scenario 3.

### Flight Information Captured

The selected flight contained the following details:

| Field            | Description                     |
|------------------|---------------------------------|
| Flight Number    | Unique Flight Identifier        |
| Airline          | Airline Name                    |
| Departure City   | TLV                             |
| Destination City | SFO                             |
| Ticket Price     | Flight Fare                     |
| Flight ID        | Internal Application Identifier |

## Usage

The flight information was automatically passed to the next page when the user clicked the "Choose This Flight" button.

The flight selection request included parameters such as:

- Flight Number
- Airline
- Price
- Flight ID

These parameters were captured from the application workflow and implemented in the Gatling scripts.

---

## 8.6 Passenger Details

Passenger information is required to complete the flight booking process.

During Scenario 3 (Complete Booking), passenger details were entered and submitted through the booking form.

### Sample Passenger Data

| Field              | Value            |
|--------------------|------------------|
| Name               | John Doe         |
| Address            | 123 Main Street  |
| City               | New York         |
| State              | NY               |
| Zip Code           | 10001            |
| Card Type          | Visa             |
| Credit Card Number | 4111111111111111 |
| Credit Card Month  | 12               |
| Credit Card Year   | 2026             |
| Name on Card       | John Doe         |

## Usage

The passenger details were submitted as part of the booking request when the "Purchase Flight" button was clicked.

The application processed these details and generated a booking confirmation page upon successful submission.

---

## 8.7 Test Data Usage Across Scenarios

The following table shows how the test data was utilized in each scenario:

| Test Data         | Scenario 1 | Scenario 2 | Scenario 3 |
|-------------------|------------|------------|------------|
| From City         | ✓          | ✓          | ✓          |
| To City           | ✓          | ✓          | ✓          |
| Flight Details    | ✗          | ✓          | ✓          |
| Passenger Details | ✗          | ✗          | ✓          |

### Scenario Coverage

#### Scenario 1 – Search Flights

Uses:

- From City
- To City

#### Scenario 2 – Choose Flight

Uses:

- From City
- To City
- Flight Details

#### Scenario 3 – Complete Booking

Uses:

- From City
  - To City
  - Flight Details
  - Passenger Details
-

## **8.8 Test Data Summary**

The test data used in this project consisted of flight search information, flight selection details, and passenger booking information. These data elements enabled successful execution of all three load testing scenarios and allowed the BlazeDemo application to process realistic user transactions during the load test.

The selected test data remained consistent throughout the execution process, ensuring reliable performance measurements and accurate comparison of test results across all scenarios.
