

9.3 Scenario 3 Execution Report – Complete Booking

Objective

The objective of this execution was to evaluate the complete booking workflow and measure application performance during an end-to-end business transaction.

Workflow Executed

Home Page

Find Flights

Choose Flight

Enter Passenger Details

Purchase Flight

Confirmation Page

Execution Process

Users searched for flights and selected a preferred flight.

Passenger information was entered into the booking form, including:

- Name
- Address
- City
- State
- Zip Code
- Credit Card Details

After submitting the booking form, the application processed the purchase request and displayed the confirmation page.

Execution Configuration

Parameter	Value
Virtual Users	20
Ramp-Up Duration	30 Seconds
Requests Executed	Home Page + Find Flights + Choose Flight + Purchase Flight
Validation	HTTP Status 200

Execution Outcome

The scenario executed successfully and completed the full booking process for all virtual users.

The generated Gatling report confirmed:

- Successful booking transactions
- Successful confirmation page generation
- No request failures
- Stable application performance during complete workflow execution

This scenario generated the highest workload because it included the complete business transaction from flight search to booking confirmation.

9.5 Report Generation

After each execution, Gatling automatically generated detailed HTML reports containing:

- Request Statistics
- Response Time Analysis
- Throughput Metrics
- Success Rate Information
- Request Distribution Graphs
- Active User Graphs

The following reports were generated during execution:

- searchflightsimulation.pdf
- ChooseFlightSimulation.pdf
- CompleteBookingSimulation.pdf
- BlazeDemo_Load_Test_Report.pdf

These reports were used for result analysis and performance evaluation.

9.6 Execution Summary

All three load testing scenarios were executed successfully using Gatling.

The BlazeDemo application processed all simulated user requests without failures and maintained stable performance throughout the execution process. The generated reports provided detailed performance metrics that were later used for response time analysis, throughput evaluation, bottleneck identification, and overall system performance assessment.

The successful execution of all scenarios confirmed that the load testing framework was implemented correctly and that the BlazeDemo application was capable of handling the configured user load efficiently.
