

13. Test Scenario Execution Report

13.1 Introduction

The Test Scenario Execution Report provides a detailed summary of the load testing activities performed on the BlazeDemo Flight Booking Application. The purpose of this report is to document the execution status, test outcomes, and performance observations for each implemented scenario.

All scenarios were executed using Gatling with a load profile consisting of 20 virtual users ramped up over a period of 30 seconds. During execution, Gatling generated detailed HTML reports that were later exported and included as project deliverables.

The generated reports serve as evidence of successful test execution and provide performance metrics used throughout this project documentation.

13.2 Scenario 1 Execution Report – Search Flights

Scenario Name

Search Flights

Objective

To evaluate the application's ability to process flight search requests under simulated user load.

Workflow Executed

Home Page

↓

Select Departure City

↓

Select Destination City

↓

Find Flights

Display Available Flights

Simulation Class

`SearchFlightSimulation.java`

Load Configuration

Parameter	Value
Virtual Users	20
Ramp-Up Duration	30 Seconds
Request Validation	HTTP Status 200
Execution Type	Load Testing

Execution Status

Result	Status
Execution Completed	PASS
Request Validation	PASS
Error Detection	PASS
Application Availability	PASS

Execution Outcome

The scenario executed successfully and all virtual users completed the flight search process without failures.

The application successfully:

- Loaded the home page.
- Processed flight search requests.
- Returned flight search results.
- Maintained stable response times.

Evidence

Generated Report:

`searchflightsimulation.pdf`

13.3 Scenario 2 Execution Report – Choose Flight

Scenario Name

Choose Flight

Objective

To evaluate the application's ability to process flight selection requests after displaying available flight options.

Workflow Executed

Home Page

↓

Find Flights

↓

Choose Flight

↓

Purchase Page

Simulation Class

ChooseFlightSimulation.java

Load Configuration

Parameter	Value
Virtual Users	20
Ramp-Up Duration	30 Seconds
Request Validation	HTTP Status 200
Execution Type	Load Testing

Execution Status

Result	Status
Execution Completed	PASS
Request Validation	PASS
Error Detection	PASS
Application Availability	PASS

Performance Summary

Metric	Value
Total Requests	60
Successful Requests	60
Failed Requests	0
Success Rate	100%
Average Response Time	476 ms
Maximum Response Time	756 ms

Execution Outcome

The application successfully processed all flight selection requests.

Key observations:

- No request failures occurred.
- Stable response times were maintained.
- All virtual users completed the workflow successfully.
- The purchase page loaded correctly after flight selection.

Evidence

Generated Report:

ChooseFlightSimulation.pdf

13.4 Scenario 3 Execution Report – Complete Booking

Scenario Name

Complete Booking

Objective

To evaluate the end-to-end booking workflow under simulated load conditions.

Workflow Executed

Home Page

↓

Find Flights

↓

Choose Flight

↓

Enter Passenger Details

↓

Purchase Flight

↓

Confirmation Page

Simulation Class

`CompleteBookingSimulation.java`

Load Configuration

Parameter	Value
Virtual Users	20
Ramp-Up Duration	30 Seconds
Request Validation	HTTP Status 200
Execution Type	Load Testing

Execution Status

Result	Status
Execution Completed	PASS
Request Validation	PASS
Error Detection	PASS
Application Availability	PASS

Performance Summary

Metric	Value
Total Requests	80
Successful Requests	80
Failed Requests	0
Success Rate	100%
Average Response Time	516 ms
Maximum Response Time	1620 ms

Execution Outcome

The application successfully completed the entire booking workflow for all virtual users.

Key observations:

- Passenger information was submitted successfully.
- Booking requests were processed successfully.
- Confirmation pages were generated correctly.
- No transaction failures occurred.
- Application stability was maintained throughout execution.

Evidence

Generated Report:

13.5 Consolidated Load Test Execution Report

Scenario Overview

Scenario	Status	Success Rate
Search Flights	PASS	100%
Choose Flight	PASS	100%
Complete Booking	PASS	100%

Overall Execution Statistics

Metric	Result
Total Scenarios Executed	3
Total Virtual Users per Scenario	20
Ramp-Up Duration	30 Seconds
Failed Scenarios	0
Successful Scenarios	3
Overall Success Rate	100%

13.6 Master Load Test Report

In addition to individual scenario reports, a consolidated load testing report was generated using the master simulation.

Simulation Class

`BlazeDemoLoadTest.java`

Purpose

The master simulation was created to verify the basic application response and generate an overall load testing report for the BlazeDemo application.

Generated Report

`BlazeDemo_Load_Test_Report.pdf`

This report serves as an overall performance reference and complements the individual scenario reports.

13.7 Execution Report Summary

All test scenarios were executed successfully using Gatling and completed without failures.

The generated execution reports confirmed:

- Successful request processing.
- Stable application performance.
- 100% transaction success rate.
- No application errors.
- Consistent response times.
- Successful handling of concurrent users.

The generated reports provide documented evidence of successful load test execution and support the performance analysis presented throughout this project.
